SOAP API Specification Application Form Example

Name: Alex Reader

Company: Alex Reader Electronics Ltd

Name of the company who will be reading the document (e.g. developer): ARE Ltd will be developing the system using our internal engineering team. We may need to contract additional external resource and will provide details should we need to extend the team. Our developers have used SOAP and web API technology previously on other projects.

Site Name(s): Beresfin Technology and Data Centre

Platform to be integrated with: We will be developing a windows-based service using C#. The service will be connecting to the SOAP interface and the strata booking system for on demand office rental bookings.

Extent of the integration: The middleware application we are developing will extract booking information from the TMS Strata Management portal used to book the various meeting rooms. This is completed through the TMS API. We will then translate this information to add a user to the ProtegeGX platform, assign and access level that will already exist and then create a unique PIN number for the user.
