

The benefits of a FLIR Latitude and ICT integration.

A FLIR Latitude integration enables you to achieve a single pane of glass view of your buildings and sites by bringing FLIR VMS (video management system) functionality into Protege GX.

Key benefits.

- > Video is triggered from events for pinpoint accuracy allowing you to easily locate an event from the log, and instantly playback archived recordings in a separate window complete with full screen and keyboard shortcut control.
- > Link cameras to icons on graphical floor plans, making it quick and easy to locate and view the relevant camera feed for a particular location.
- > Associate cameras to doors, inputs, areas, and outputs, allowing you to retrieve footage based on any change of status - for instance, when a motion sensor is triggered or a door is opened.
- > Include camera windows in customizable status pages to display live video coverage of your site. Each status page can include up to 16 panels, making them ideal for creating a camera matrix or video wall for use in control rooms.
- > Automatic popups with live video stream for door events allow you to see who is at the door, or when a door has been forced open.
- > Eliminate doubled workloads by viewing VMS events, like Motion Detected, directly within Protege GX.
